

Transforming Spaces with Superior Craftsmanship and Streamlined Installation

Modern Aluminum Structural Solutions, Made to Last in the USA

Two Install Configurations: Top-Down or Bottom-Up

Parallel's cladding system offers two installation configurations — top-down or bottom-up — giving installers flexibility to choose what works best for each project. Top-down installation significantly enhances efficiency by speeding up board attachment and simplifying board replacement.

Interlocking Boards: Reveal Options and Concealment

Parallel's interlocking cladding boards hold themselves in place — unlike tongue-and-groove systems that typically require hard-fastening. This click-together design not only conceals all fasteners but also allows for an adjustable "reveal" or "no-reveal" look using the same component.

Wider Trim Channels: Avoid Fastener Interference

Parallel's trim profiles feature wider channels to accommodate fasteners, ensuring screw heads don't interfere with cladding/soffit boards. This thoughtful design feature saves installation time and prevents interference that could compromise your installation's stability.

No Holes or Taped Ends: Safer and Simpler Install

Unlike competitors, Parallel doesn't add holes or tape to the ends of cladding, soffit boards, and battens. This thoughtful design allows finishes to extend completely to each end, eliminating the need to trim off taped portions. This prevents saw snags during cutting, enhancing both safety and material efficiency.

Fasteners + saw blades now available with material orders! Get in touch with our team for more information.
